Rising apartment prices in Gush Dan Oded Saban Chen Yanko Git Hub

Research questions

- Has there indeed been an increase in apartment prices as noticeable
- 2. Given the current price of an apartment, is it possible to predict its price in about 10 years

Data sources

Crawling - \square

<u>ad - Information on real estate</u> transactions

- First, we used the 'BeautifulSoup' library to crawl the relevant data from ad site.
- Second, we add 2 columns, the first is DealYear, and the second is DealMonth.
- Finally, we saved the data in the allDf.csv file

Data cleaning

- 1. NaN handling
- 2. Convert variables to uniform formats
- 3. Outliners handling

Data cleaning - NaN handling

We removed the data that appears as NaN in the PricePerSq column, because with this column we will analyze the data and it will not be possible if we have NaN values there.

```
df.isna().sum()
In [182]:

Data cleaning – Convert variables to uniform formats

memory usage: 2.5+ MB

We converted the values of the columns: Price, PricePerSq, DealYear, DealMonth from float64 and Object to int32.

This is so that we can handle the data optimally when all the variables are of the same type.

It can be seen that during the conversion process of the Price and PricePerSq columns we deleted the character - , because an int32 variable could not contain the character - , .

```
#handle columns types
      df basic['PricePerSq'] = df basic['PricePerSq'].astype(int).str.replace(',', '').astype(int)
      df_basic['DealYear'] = df_basic['DealYear'].astype(int)
      df_basic['DealMonth'] = df_basic['DealMonth'].astype(int)
      df basic['Price'] = df basic['Price'].astype(str).str.replace(',', '').astype(int)
df_basic.info()
                                                             df basic.info()
<class 'pandas.core.frame.DataFrame'>
                                                             <class 'pandas.core.frame.DataFrame'>
                                                             Int64Index: 27231 entries. 0 to 27381

Data cleaning - Outliners

 We handled outliners with percentages and during the process we used the boxplot graph belonging to the matplotlib library to analyze the efficiency of the handled.

```
def remove_outlier(df_in, col_name):
                q1 = df_in[col_name].quantile(0.25)
                q3 = df in[col name].quantile(0.75)
                igr = q3-q1 #Interquartile range
               fence low = q1-1.5*iqr
               fence_high = q3+1.5*iqr
               df out = df in.loc[(df in[col name] > fence low) & (df in[col name] < fence high)]</pre>
               return df_out
                                                                         df_test = df_clear.loc[df_clear['City'] == 'holon']["PricePerSq"]
plt.boxplot(df basic.loc[df basic['City'] == 'holon']["PricePerSq"])
                                                                         plt.boxplot(df test)
plt.show()
                                                                         plt.show()

LinePlot

What the graph contain:

The graph contain 2 axes : 1. X-axis is the DealYear

2. Y-axis is the PricePerSq

Conclusion:

With the help of the graph, we see that over the years there has been an increase in apartment prices in the various cities in Gush Dan.

BarPlot

What the graph contain:

The graph contain 2 axes : 1. X-axis is the DealYear 2. Y-axis is the PricePerSq

Conclusion:

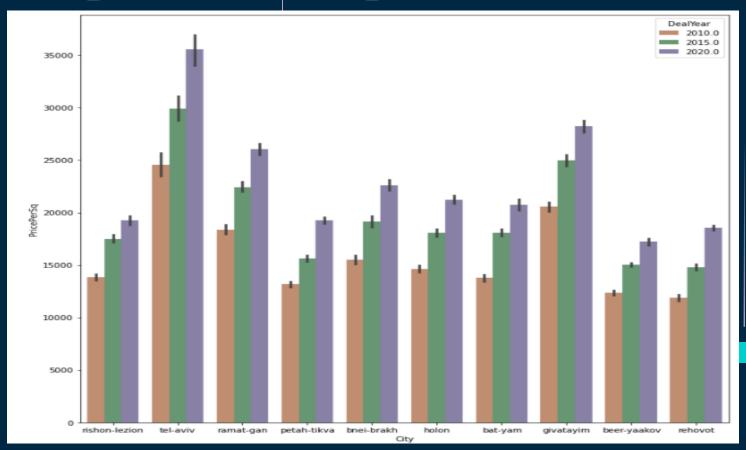

Ramat-Gan

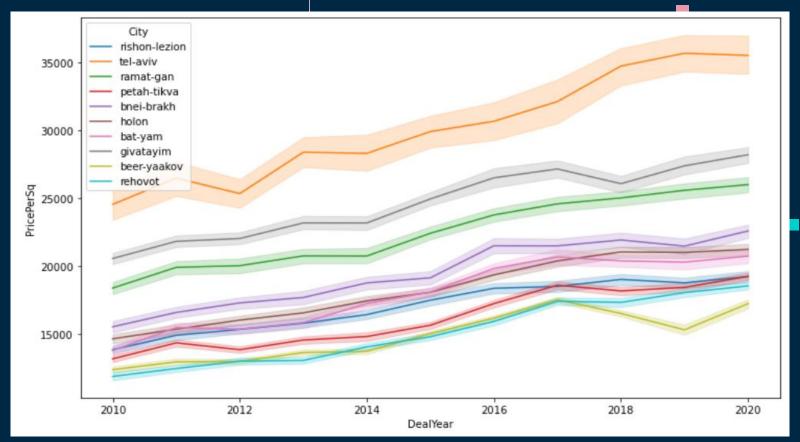

With the help of the graph, we see that over the years there has been an increase in apartment prices in the various cities in Gush Dan.

Holon

Machine Learning

Machine Learning – linear regression

- We used 'sklearn' library and linear regression.
- With their help we trained a model that can predict the average price per square meter in the city and in the year we chose.

```
x_train, x_test, y_train, y_test = train_test_split(df.D
ealYear, df.PricePerSq)
plt.scatter(x train, y train, label='Training data', col
or='r', alpha=.7)
plt.scatter(x test, y test, label='Testing data', color
='g', alpha=.7)
plt.legend()
plt.title('Test Train Split')
plt.show()
LR = LinearRegression()
LR.fit(x train.values.reshape(-1,1),y train.values)
```

LinearRegression()

Machine Learning - linear regression

 The program asks the user to enter the year for prediction and prints the model predicted price for that year.

```
year = float(input("Please enter a year: "))
prediction_price = LR.predict(np.array([[year]]))[0]
print("the prediction price in " + choosen_city + " is " + str(int(prediction_price)) + " per square meter")

Please enter a year: 2030
the prediction price in rehovot is 25805 per square meter
```

Conclusions

In conclusion, according to the findings of the project, we understand that there has indeed been an increase in the prices of apartments in Gush Dan, and moreover, with the help of machine learning, we conclude that in the coming years prices will continue to rise.
